

Costly bearings breaking down in your conveyors? Dichtomatik develops superior solutions and protection for material handling manufacturers.

Constantly moving and used in many different industries, costly bearing assemblies in conveyor systems encounter extreme harsh conditions. A well-known material handling manufacturer saw its valuable bearings fail countlessly from high contaminant intrusion because of defective sealing products from its suppliers. Collaborating with the manufacturer, Dichtomatik developed a customized sealing solution to protect the bearings within the conveyor systems.

As a result, the material handling manufacturer saw improved operating times in its conveyors due to the decrease of contaminant intrusion. The manufacturer also saw cuts in its own costs as Dichtomatik developed a less expensive, and more efficient sealing design with increased longevity in order to maximize uptime. Most importantly, Dichtomatik worked alongside the manufacturer in all stages of development to create a customized solution that best their needs.
